## Production Herd Feeding

The milking herd is divided into several groups. The number of groups depends on the number of research projects being conducted. Dairy Comp 305 lists the various groups and the number of animals in each group.

The entire herd is currently milked two times per day.

The TIE-STALL GROUP is potentially made up of research project animals, fresh animals that are monitored and a HOSPITAL GROUP. The Hospital Group includes those animals under veterinary care, mastitis infection, injury or illness requiring them to be separated from the herd and or having to make sure that their treated milk is discarded. When the tie-stall barn is at capacity with research animals, the hospital group and fresh cows will be housed in either the heifer free-stall barn or milk cow free-stall barn.

The number of different rations fed to cows will vary depending on research projects being conducted. The manager and the feeder will have this information.
